Project : Inventory Management System (IMS)

Project Description:

This project is based on the **Inventory Management System** and developed on java using eclipse. In this IMS user can know each information about stock of organization.

We check all the medicine and do it in database entry, and then it is distributed in every state.

A separate login model is made for each state so that any medicine that he goes to can be seen by him and the person who is sending it can also see it. We get the medicine stored in the warehouse checked and match the date and manufacturing date of the system., then it shows that which medicine has expired, which has expired, we send it back to the same place where the manufacturing has taken place.

In my project my role was to view the data of all the tables at once, I had a lot of records to see together, so I joined all the tables. I kept all the records in a temporary table and at night corn scheduler would drive the scheduler and show the records to the manager in the morning time of the day.

When needed, we used to run croon scheduler every 12 hours even during the day.
